Notes

Note 1: *Spiranthes cernua* has only been found once in the Ivy Creek Natural Area.

It was found growing beside the Peninsula Trail with Trailing Arbutus.

Because of its habitat, it was most likely what is now called *Spiranthes ochroleuca* or *S. cernua* var. *ochroleuca*.

Note 2: Vegetative plants of a *Prenanthes* sp. were found in 2010. We were not able to determine the exact species.

Note 3: Vegetative plants of a *Tragopogon* sp. were found in 2010. We were not able to determine the exact species.

Note 4: The tree off the Red trail traditionally called a Shagbark Hickory is actually Red Hickory, *Carya ovalis*.

Note 5: Our plants have some of the characteristics of *Rhamnus frangula*. They need to be critically examined at flowering and again with mature fruit to determine which *Rhamnus* grows at Ivy Creek.

With the exception of the genus *Botrychium*, plant identifications follow those given by:

1. Manual of the Vascular Flora of North Carolina; Radford, Ahles, and Bell; 1968; University of North Carolina Press
2. Flora of West Virginia; Strausbaugh and Core; 1977; Seneca Books
3. Manual of Vascular Plants, second edition; Gleason and Cronquist; 1991; New York Botanical Gardens

The treatment of the genus *Botrychium* is as described by Wherry in The Fern Guide; Wherry; 1961; Doubleday

Cultivated plants in the beds around the education building and the quiet area are not included in this survey.
